Vegetation Production & Net Primary Productivity

Product Description

MOD 17 is a Level 4 product consisting of 8-day Net Photosynthesis (PSN, Parameter 3716) and Net Primary Production (NPP, Parameter 2703). Annual NPP is the time integral of the PSN product over a year.

Research & Applications

This product provides an accurate measure of terrestrial vegetation growth and production activity. The theoretical use is to define the seasonally dynamic flux of terrestrial surface carbon dioxide for climate modeling. Fluxes will be computed specific to each vegetation type. The practical utility is to measure crop yield and forest production and any other socially significant products of vegetation growth. As this global NPP product becomes regularly available, a wide variety of derived products are expected to be developed making regionally specific estimates of crop production. The value of an unbiased, regular source of crop and forest production estimates for global political and economic decision making is immense.

Data Set Evolution

The NPP parameter is the yearly integral of the PSN which is obtained from the product of PAR (Photosynthetically Active Radiation), FPAR (Fraction Photosynthetically Active Radiation) and conversion efficiency coefficients obtained from other MODIS products and other sensors and ancillary data. The algorithms for these products are based on the original logic of Monteith (1972) which relates PSN and NPP to the amount of Absorbed Photosynthetically Active Radiation (APAR). The vegetation indices (MVI) along with climate and the land cover product are used to estimate APAR.

**MOD 17
PRODUCT SUMMARY**

Coverage:
 global

Spatial/Temporal Characteristics:
 0.5, 1,10 km/every 8 days and yearly

Key Science Applications:
 interannual variability of vegetation

Key Geophysical Parameters:
 NPP, photosynthesis, respiration

Processing Level:
 4

Product Type:
 standard, at-launch

Science Team Contact:
 S.W. Running

Vegetation Production & Net Primary Productivity

Figure 35. **Global Net Primary Production During 1987.** This dataset is produced using 1 × 1 degree gridded climate data from 7000 weather stations distributed globally, Mathews land cover classes collapsed into our six classes, biome specific NDVI-LAI relations used to estimate LAI from NOAA/NASA Pathfinder data and ecosystem simulation model, BIOME-BGC.
